KSH International Ltd

Concall Tracker — reading the earnings calls to judge the earning trigger and management consistency

Report date: 5 July 2026 | Screener ticker: KSHINTL | BSE: 544664 / NSE: KSHINTL | Calls read: 3 (all financial year 2026)

1. Snapshot

What the business does (one line): KSH International makes **magnet winding wire** — the insulated copper wire that is wound into the coils inside electrical machines. Its flagship product is **CTC (Continuously Transposed Conductor)**, a complex, precision-engineered wire that goes into large power transformers (the big boxes that step voltage up and down on the electricity grid). It sells business-to-business to roughly 120 transformer makers in India and abroad, and it is the largest exporter of winding wire from India.

Number	Value	What it means in plain English
Market value (market cap)	₹5,743 crore	What the whole company is worth on the stock market today — about ₹57 billion.
Sales, FY26	₹3,107 crore	Total money brought in from selling wire in the year to March 2026 — up about 61% from ₹1,928 crore the year before. Note: copper price is passed straight through to customers, so a big chunk of this "growth" is just higher copper prices, not real volume.
Net profit, FY26	₹110 crore	What was left as profit after all costs and tax — up about 62% from ₹68 crore last year. Genuinely strong profit growth.
Operating profit (EBITDA), FY26	₹190 crore	Profit from the core business before interest, tax and wear-and-tear charges — up from ₹123 crore. ("EBITDA" = earnings before interest, tax, depreciation and amortisation.)
Operating margin	~6%	Operating profit as a share of sales. Looks thin, but it is misleading: copper is a pass-through and inflates the sales figure, so the real measure the company uses is profit per tonne of wire (see below).
Profit per tonne (EBITDA/tonne), FY26	~₹67,600	Operating profit earned on each tonne of wire sold — up sharply from ₹52,500 in FY25. This is the number that shows the business is genuinely getting more profitable, stripping out the copper-price noise.
Return on capital (ROCE) / equity (ROE)	21.4% / 20.1%	For every ₹100 of capital and of owners' money in the business, it earned about ₹21 and ₹20 — a healthy return.
Debt vs operating profit	0.39x	Borrowings are now well under half of one year's operating profit, down from 1.21x — the company used its 2025 share-sale money to clear most of its debt. A comfortable, low-debt position.
Valuation (P/E)	51.6	The share price is about 52 times last year's profit per share — an expensive, high-expectations valuation. The market is pricing in a lot of future growth.

Note on numbers: KSH reports **standalone** figures and so does Screener, so there is no consolidated-vs-standalone gap to flag here. The company listed on the stock market only in late December 2025, so financial history as a public company is short.

2. Concall coverage

KSH is a newly-listed company (its shares began trading in late December 2025), so only **three earnings calls exist** — all held within financial year 2026. All three were downloaded from Screener and read in full. Because fewer than four calls are available, the consistency read below spans only about five months and is therefore **limited** — there is not yet a multi-year record to test the management's promises against.

Quarter	Call date	Transcript read?
Q2 & H1 FY26 (half-year to Sep 2025) — the company's debut call	6 Jan 2026	Yes — full
Q3 & 9 months FY26 (to Dec 2025)	9 Feb 2026	Yes — full
Q4 & full-year FY26 (to Mar 2026) — latest	26 May 2026	Yes — full

Span: 3 calls over roughly 5 months, all within one financial year (FY26).

★ Latest concall highlights — Q4 & full-year FY26 (call held 26 May 2026)

- **Record year.** Full-year sales ₹3,107 crore (up 61%) and net profit ₹110 crore (up 62%) — both all-time highs. Q4 profit ₹34.5 crore was up 87% on the same quarter last year.
- **Profit per tonne kept climbing.** Q4 profit per tonne of wire hit ~₹74,000, up from ~₹64,500 the previous quarter and ~₹60,000 a year ago — driven by richer product mix and a jump in exports. Management raised its "sustainable" range to ₹65,000–₹70,000 per tonne (it had earlier guided ₹65,000–₹67,000).
- **Exports exploded.** Q4 export revenue was up 92% on the same quarter last year, with new transformer customers being won across the Americas and Europe. Management wants to lift exports back to about 40% of sales (they were ~27–30% in FY26).
- **Balance sheet cleaned up.** Borrowings versus operating profit fell to 0.39x from 1.21x, after using the 2025 share-sale money to repay ~₹226 crore of debt. A rooftop solar plant (to cut power costs) was commissioned.
- **Tone:** confident and measured. Guidance for FY27 is "at the very least" repeat FY26's 21% volume growth, with new customers described as "modest initial quantities" that could scale — no over-promising.

Business mix & capacity (quick-glance panel)

India vs exports: Exports were about **27% of sales in FY26** (roughly a quarter of the business is overseas; the rest, ~73%, is sold within India). Management has historically run exports at 30–40% and wants to push back towards 40% over the next couple of years.

Specialised vs standard wire: ~75% of sales is higher-value specialised wire (led by CTC for power transformers); ~25% is standard round wire (for EV motors, air-conditioner and fridge compressors).

Capacity & utilisation: Installed capacity rose from 29,000 tonnes a year to **43,445 tonnes** by March 2026 (the new Supa plant's first phase came online in October 2025), heading to **~59,000 tonnes by FY27** as Phase 2 completes. Utilisation was ~**70% consolidated in Q4** — it dipped because fresh capacity was added faster than volumes filled it; older plants still run at ~80–85%. Peak utilisation of ~85% typically takes 2–3 years to reach on new capacity. In short: there is a large runway of unused capacity to grow into.

3. Earning Trigger thesis ★

KSH's earning story is genuine and concrete: it sits at a **supply bottleneck in India's power-grid boom.** Electricity transmission and distribution (T&D) is in a multi-year expansion — driven by renewable energy, grid modernisation, and power-hungry AI data centres — and every transformer built needs high-quality winding wire, which is in short supply. KSH is **doubling its capacity** (29,000 → 59,000 tonnes) right into this demand, is the **only Indian company qualified to supply the highest-value HVDC 400kV transformers** (HVDC = high-voltage direct current, used to move renewable power over long distances), and is steadily **shifting its mix** towards these richer products, which has already lifted profit per tonne from ₹52,500 to ₹67,600 in one year. The India CTC market is estimated to grow from ~40,000 tonnes (FY25) towards 70,000–75,000 tonnes by FY27–28 and 100,000–120,000 tonnes by 2030.

Trigger	What management said	Evidence so far	Time horizon	Strength
Capacity doubling (29k→59k tonnes)	Supa plant Phase 1 (12k t) live Oct 2025; Phase 2 to complete FY27	Phase 1 delivered on time; volumes up 21% in FY26; utilisation has room to climb from ~70%	Now → FY27	**Strong**
T&D / power-grid super-cycle	Structural multi-year demand from renewables, grid, data centres; wire is the bottleneck	Sales +61%, profit +62% in FY26; exports +92% in Q4; new global customers being added	Multi-year	**Strong**
HVDC — only qualified Indian supplier	37 cumulative HVDC transformer orders being supplied over 12–18 months; highest value-add product	Real orders (incl. BHEL, GE), but volume still small/ negligible in the total today	FY27 onward	**Moderate — real edge, small today**
Mix shift lifting profit per tonne	65k–70k/tonne "sustainable"; higher 765kV, HVDC and export share	Delivered: ₹52,500 → ₹67,600; Q4 ~₹74,000. Beat its own earlier guidance	Ongoing	**Strong**
New verticals: EV motor (PEEK) & compressor wire	Licensed PEEK-wire technology for 800V EV traction motors; EV/ compressor standard wire	Still "in programs"; management says meaningful volume only after FY27; low single digits today	FY28+	**Unproven — optionality, not yet earning**

4. Management Consistency scorecard

Only three calls exist, all in FY26, so this is a short window. Within it, however, management has been notably consistent and has largely **delivered or beaten** what it said.

Period / promise made	What was promised	What actually happened	Verdict

Jan & Feb 2026 — profit per tonne	₹65,000–₹67,000 per tonne is "sustainable"	Delivered ₹67,600 for FY26; Q4 hit ~₹74,000; range later raised to ₹65,000–₹70,000	**Delivered (beat)**
Feb & May 2026 — volume growth	~21% volume growth for FY26; repeatable in FY27	Delivered exactly 21% for FY26; reiterated "at least 21%" for FY27	**Delivered**
Jan 2026 — use of share-sale money	Repay ~₹226 crore of debt from IPO proceeds	~₹225.9 crore repaid; debt/operating-profit fell 1.21x → 0.39x	**Delivered**
Jan 2026 — Supa expansion	Phase 1 (12k t) online; Phase 2 to reach 59k t by FY27	Phase 1 came online Oct 2025 as stated; Phase 2 "on track" for FY27	**Delivered / on track**
All 3 calls — working capital	Cut working-capital days over the coming quarters (raise supplier credit)	Still 65–68 days; payable days improving slowly; described as gradual, "not overnight"	**Partly / in progress**
All 3 calls — HVDC ramp	HVDC to become a meaningful contributor as more orders flow	37 orders being supplied; still negligible in totals — honestly flagged as such each time	**Too early**

Narrative drift: essentially none. The story — power-grid super-cycle, capacity doubling, CTC/HVDC leadership, mix-led profit-per-tonne gains — has been repeated almost word-for-word across all three calls, with each call adding evidence rather than changing the plot. Management has been careful **not** to over-hype: it repeatedly played down HVDC's near-term size, guided profit per tonne conservatively (then beat it), and framed new export customers as small initial trials. The only genuine gap is working capital, which remains high and is being fixed only gradually — and management has been upfront about that. The single caution is simply that this clean record is only about five months old.

5. Bottom line — two verdicts

Durable earning trigger? → YES

There is a clear, concrete and still-live driver, and it is already showing up in the numbers. KSH is expanding capacity straight into a multi-year power-grid boom where its product is a genuine bottleneck; it holds a real competitive edge (sole Indian HVDC qualification, 20-year CTC track record, hard-won utility approvals that take new entrants 5–7 years to earn); and the shift to higher-value products has lifted profit per tonne by nearly 30% in a single year while sales and profit each grew ~60%. The main risks — high valuation (52x earnings), still-high working capital, and rising industry capacity that could eventually pressure pricing — temper the upside but do not undermine the trigger itself.

Management consistent? → MAYBE

This is a "maybe" purely because of **how short the record is**, not because of any weakness in it. Across the only three calls available — all within FY26 — management delivered or beat every specific promise it made (profit per tonne, 21% volume growth, debt repayment, on-time plant commissioning), kept a steady and honest narrative with no story-drift, and consistently under-promised rather than over-hyped. That is an excellent start. But three calls over five months is not enough to prove consistency **over time**, and the one open item (cutting working capital) is still unresolved. A year or two more of the same would justify a clear "Yes"; today the honest verdict is a positive-leaning Maybe.

Sources: KSH International Ltd earnings-call transcripts for Q2/H1 FY26 (6 Jan 2026), Q3/9M FY26 (9 Feb 2026) and Q4/FY26 (26 May 2026), plus Screener.in financial data. All figures are standalone. This report reads the concalls to judge the earning trigger and management consistency; it is not investment advice.
