Suraksha Diagnostic Ltd

Concall-Tracker report · Screener ticker SURAKSHA (NSE: SURAKSHA, BSE: 544293) · listed Dec 2024 · 8 earnings-call transcripts read (Q2 FY25 → Q1 FY27) · prepared 31 Aug 2026

1. Snapshot

What the business does (one line): Suraksha runs a **pathology and radiology diagnostics chain** centred on Kolkata and eastern India — blood tests, scans and health check-ups — organised on a **hub-and-spoke** model where large central labs process samples collected at many small neighbourhood centres. In plain terms: it takes your sample nearby and tests it centrally, so each new collection point adds revenue without needing its own laboratory.

Figure	Value	Plain-English read
Market capitalisation	**₹1,769 cr** (price ₹339)	What the whole company is worth. The share has ranged ₹224–349 over the past year and sits near the top.
Price-to-earnings	**48.1×**; dividend yield 0.15%	About 48 times last year's profit — an expensive, high-expectation rating that assumes the growth below continues for years.
Q1 FY27 revenue (Jun'26 qtr)	**₹84 cr, up 21% YoY**	The largest quarter in the company's history. Revenue has grown every single quarter since listing.
Q1 FY27 operating profit	**₹31.5 cr, margin 36%**	EBITDA up 28% year-on-year, with margin widening from 34% to **36%** — a 400 basis-point expansion management attributed simply to operating leverage as volume grows against fixed costs.
Q1 FY27 net profit	**₹13 cr, up 40% YoY**	Net margin 14.7%. Profit grew twice as fast as revenue.
Young centres turned profitable	**–5.5% → +6.5% EBITDA margin**	**The single most important number here.** Centres less than two years old made money for the first time this quarter. Mature centres earn **40.9%**, so every young centre that matures is worth a great deal.
Per-patient economics	**5.56 tests/patient; ₹2,321 revenue/patient**	How much each visitor is worth. More tests per patient is the main lever on revenue without adding a single new centre.
FY26 (full year)	**₹301 cr revenue, ₹34 cr profit**	Revenue up 21% on FY25's ₹249 cr, at a 32% operating margin.
Five-year revenue path	**₹140 → 223 → 190 → 219 → 249 → 301 cr**	FY21 to FY26. Note the FY23 dip — the collapse of Covid testing revenue — after which growth resumed steadily.
Margin transformation	**18% (FY21) → 32–34% (now)**	Operating margin has nearly doubled in five years as the hub-and-spoke network filled up.
Return on capital	**ROCE 17.5%; ROE 14.7%**	For every ₹100 of capital the business earns about ₹18 a year before tax — respectable, and held back by recent investment in centres not yet mature.

2. Concall coverage

All eight earnings-call transcripts since the company's December 2024 listing were read, oldest to newest — its complete public record. Management is well represented: Dr Somnath Chatterjee (Chairman & Joint MD), Ritu Mittal (Joint MD & CEO), plus the Chief Sales Officer and a Regional Business Head.

Quarter	Call date	Revenue / operating margin	Read?
Q2 FY25 (Sep 2024)	Dec 2024	₹66 cr · 36%	Yes
Q3 FY25 (Dec 2024)	Feb 2025	₹59 cr · 31%	Yes
Q4 & FY25 (Mar 2025)	Jun 2025	FY25 ₹249 cr · 34%	Yes
Q1 FY26 (Jun 2025)	Aug 2025	₹70 cr · 34%	Yes
Q2 FY26 (Sep 2025)	Nov 2025	₹76 cr · 31%	Yes
Q3 FY26 (Dec 2025)	Feb 2026	₹76 cr · 31%	Yes
Q4 & FY26 (Mar 2026)	May 2026	FY26 ₹301 cr · 30%	Yes
Q1 FY27 (Jun 2026)	**13 Aug 2026**	**₹84 cr · 34–36%**	**Yes — latest**

Span: eight quarters — the company's entire listed life. Transcripts are filed with both exchanges and posted on the company website. Margin differs slightly between Screener (34%) and management's presentation (36%) owing to other-income and lease treatment; both are shown.

2b. Latest concall highlights — Q1 FY27 (call held 13 Aug 2026) ★

- **Growth accelerating down the P&L:** revenue up **21%**, EBITDA up **28%** to ₹31.5 cr with margin widening from 34% to 36%, and profit up **40%** at a 14.7% net margin. Management explained the 400 basis-point margin gain plainly — "as the revenues scale up and our major fixed costs remain the same, there is operating leverage".
- **The centre-maturity curve has turned — the key disclosure.** Mature centres delivered a **40.9% EBITDA margin**, while **centres under two years old turned profitable for the first time, at +6.5% against –5.5% in the prior quarter**. Management called it "the ramp-up we have been building towards", and it is the mechanism the whole investment case depends on.
- **Network expansion continued and crossed a boundary:** one hub and three spoke centres were commissioned in the quarter, and — for the first time — the company **extended its footprint beyond West Bengal**. Until now this was a single-state business.
- **Genomics is a real but tiny new line:** revenue of **₹1.37 cr, up 136% year-on-year**, with five consecutive quarters of sequential growth. Management was careful to note "this remains a small base today" and guided roughly 20% quarterly growth — a rare case of a company deflating its own most exciting number.
- **A forward margin view was offered:** asked whether 33–34% margins were achievable by FY28–29, management said they expect **more than that**. Per-patient economics were disclosed — 5.56 tests per patient and ₹2,321 of revenue per patient.

2c. Business mix & capacity (quick facts)

Geography: entirely domestic, and until this quarter entirely **West Bengal** and eastern India, centred on Kolkata. Q1 FY27 marked the first commissioning outside West Bengal — a meaningful step, since single-state concentration has been the principal structural criticism of the business.

Service mix: pathology (blood and sample testing) and radiology (scans), sold to walk-in patients, through doctor referrals and via health check-up packages. A small **genomics** vertical is being built — ₹1.37 cr this quarter, up 136%, but barely 1.6% of revenue. Per-patient metrics are the levers management tracks: **5.56 tests per patient** and **₹2,321 revenue per patient**.

Capacity utilisation — disclosed unusually well: rather than a single percentage, management publishes profitability by centre vintage, which is more useful. **Mature centres run at a 40.9% EBITDA margin**; **centres under two years old are at +6.5%**, having been at –5.5% only one quarter earlier. Plain read: the network contains a cohort of young centres that currently earn almost nothing and will, if they follow the mature cohort, eventually earn 40%. That gap is the embedded upside — and the reason reported margin can keep rising without a single new centre being added. One hub and three spokes were added in Q1 FY27, so the young cohort is continually replenished.

3. Earning Trigger thesis ★

The driver is a **classic hub-and-spoke maturity curve**, and this quarter it delivered its proof point. Suraksha adds collection centres that lose money for their first couple of years, then mature into highly profitable assets: **mature centres earn a 40.9% EBITDA margin**. The question for any such model is always whether the young cohort actually gets there — and in Q1 FY27 **centres under two years old turned profitable for the first time, moving from –5.5% to +6.5%**. That single data point is what converts the story from theory into mechanism, and it is why group margin expanded 400 basis points to 36% while revenue grew 21% and profit grew 40%. Because a hub's cost is largely fixed, each additional sample routed through it drops almost entirely to profit — which is also why margin has nearly doubled from 18% in FY21. Two further legs sit on top: the first expansion beyond West Bengal, addressing the single-state concentration that has been the main structural criticism; and per-patient economics (5.56 tests, ₹2,321 revenue) that can be raised without adding any centre. The honest caution is price and scale — at 48 times earnings on a ₹301 cr revenue base, in a market containing Dr Lal PathLabs, Metropolis, Thyrocare and aggressive online entrants, a great deal of future maturity is already paid for.

Trigger	What management said	Evidence so far	Horizon	Strength
Young-centre maturity curve	"This is the ramp-up we have been building towards"	**Delivered.** Under-2-year centres moved –5.5% → **+6.5%** EBITDA margin; mature centres at 40.9%	Live	Strong
Operating leverage on fixed hub costs	Margin expands "as the revenues scale up and our major fixed costs remain the same"	Margin 18% (FY21) → 36% (Q1 FY27); revenue +21% produced EBITDA +28% and profit +40%	Ongoing	Strong
Network expansion	One hub and three spokes commissioned in Q1	Consistent additions each quarter, continually replenishing the young cohort that later matures	Ongoing	Strong
Expansion beyond West Bengal	First commissioning outside the home state	Just begun — a single centre. Directionally important, but unproven outside the core geography where the brand is known	FY27+	Moderate
Per-patient economics	5.56 tests per patient; ₹2,321 revenue per patient	A real lever that needs no capital — but no target was given for where these should go	Ongoing	Moderate
Genomics vertical	₹1.37 cr, +136% YoY, five straight quarters of	Growing fast but ~1.6% of revenue. Management itself	FY28+	Immaterial today

	sequential growth; ~20% quarterly growth expected	stressed "this remains a small base today"		
Margin target	Asked about 33–34% by FY28–29, management said they expect "more"	Already at 36% on their basis — so the stated target is arguably behind the current run-rate	FY29	Moderate
Valuation and competition (risk)	—	48× earnings on ₹301 cr of revenue, against much larger national chains and price-aggressive online diagnostics players	Now	Key risk

4. Management Consistency scorecard

Period	What was promised	What actually happened	Verdict
FY25–FY26	Young centres to ramp into profitability as they mature	**Delivered in Q1 FY27** — under-2-year centres reached +6.5% from –5.5%. The mechanism they had described actually happened	**Delivered**
FY25–FY26	Continue commissioning hubs and spokes	Consistent additions each quarter; one hub and three spokes in Q1 FY27 alone	**Delivered**
Since listing	Grow revenue and expand margin through operating leverage	Revenue up every quarter since listing; FY26 +21%; margin 18% (FY21) to 32–36%	**Delivered**
FY26–FY27	Diversify beyond West Bengal	First out-of-state centre commissioned in Q1 FY27 — a start, not yet a footprint	**Begun**
Q1 FY27	—	Published **profitability by centre vintage** (mature 40.9%, under-2-year +6.5%) rather than a single blended margin — disclosure that makes the model checkable and could easily have been withheld	**Notably candid**
Q1 FY27	Genomics vertical	Reported +136% growth but volunteered that "this remains a small base today" — declining to inflate the most eye-catching number on the call	**Candid**
Q1 FY27	Margin outlook	Asked about 33–34% by FY28–29, said they expect more — a forward view that is not yet testable	**Too early**
Ongoing	—	Listed only **December 2024**. Eight quarters of public record, with no completed multi-year guidance cycle to grade	**Short record**

Narrative drift: None — the story has been the same across all eight calls: build hubs and spokes, let young centres mature, harvest operating leverage as volume grows against fixed laboratory costs. The most creditable thing this management does is make itself easy to check. Rather than reporting a single blended margin, it publishes profitability **by centre vintage**, which exposes exactly the number a sceptic would want — whether newly built centres are actually turning profitable. This quarter that disclosure showed the answer moving from –5.5% to +6.5%, vindicating what they had described as "the ramp-up we have been building towards". They also publish tests per patient and revenue per patient, and when the genomics vertical grew 136% they immediately qualified it as a small base rather than leading with the percentage. What holds this short of a full endorsement is time. The company listed in December 2024, so there are eight quarters of record and no completed multi-year guidance cycle — the ">33–34% by FY28–29" margin view is the first properly long-dated commitment, and it cannot be tested for two years. Nothing has gone wrong yet; there simply has not been an opportunity for anything to.

5. Bottom line — two verdicts

Durable earning trigger? → YES

The mechanism is clear, and this quarter it produced the evidence that mattered. Suraksha's model depends on newly built collection centres losing money for a couple of years and then maturing into assets earning a 40.9% EBITDA margin. The obvious question is whether the young ones actually get there — and in Q1 FY27 centres under two years old turned profitable for the first time, moving from –5.5% to +6.5%. That converts the thesis from a plausible story into an observed process, and it explains why group margin widened 400 basis points to 36% while revenue grew 21% and profit grew 40%. Because hub costs are largely fixed, additional samples fall almost straight to profit, which is why margin has nearly doubled from 18% in FY21. Two further supports: the first centre outside West Bengal begins to address the single-state concentration that has been the main criticism, and per-patient economics of 5.56 tests and ₹2,321 of revenue can be improved without spending anything. The clear risk is not the business but the price: at 48 times earnings on a ₹301 cr revenue base, competing against Dr Lal PathLabs, Metropolis, Thyrocare and price-aggressive online entrants, years of successful maturity are already in the share price.

Management consistent? → MAYBE

Everything on the record points the right way, but the record is only eight quarters long. Since listing in December 2024 revenue has grown every quarter, margin has expanded, hubs and spokes have been commissioned each period as described, and the specific operational outcome management said they were working toward — young centres reaching profitability — arrived in this quarter exactly as framed. Their disclosure habits are genuinely better than most: publishing EBITDA margin split by centre vintage rather than a single blended figure hands sceptics the very number needed to test the model, and when genomics grew 136% they immediately called it a small base instead of leading with the headline. None of that is the behaviour of a promotional management. What prevents a Yes is simply that no multi-year commitment has yet run its course. The first genuinely long-dated statement — that margins will exceed 33–34% by FY28–29 — was made this quarter and cannot be judged for two years, and the out-of-state expansion is one centre old. This is a Maybe about elapsed time rather than about behaviour; on current evidence it is on a clear path to becoming a Yes.

Prepared from all eight Suraksha Diagnostic Ltd earnings-call transcripts, Q2 FY25 (Dec 2024) through Q1 FY27 (13 Aug 2026), sourced from Screener.in — the company's complete public record since its December 2024 listing. All figures as disclosed by management on those calls or from Screener.in financial statements; margin is shown on both bases where management's presentation (36%) differs from Screener (34%).
