Emmvee Photovoltaic Power Ltd

Concall Tracker report | Screener ticker: EMMVEE (NSE/BSE 544608) | Prepared 5 July 2026

Reading the earnings conference calls ("concalls") to judge two things: (1) is there a real, durable driver of future profit, and (2) has management said consistent things call-to-call and delivered on them?

1. Snapshot

What the business does: Emmvee is a Bengaluru company (in solar since 1992) that manufactures **solar panels ("modules")** and the **solar cells** that go inside them. Solar cells are the small squares that turn sunlight into electricity; modules are the finished panels sold to power producers. Emmvee makes money by selling these panels and cells, mostly to large Indian renewable-power developers. It listed on the stock market in November 2025, so its life as a public company — and its concall history — is only about six months old.

Important data note — read this first. The free Screener.in financial tables for Emmvee are **standalone and appear to badly under-count the group**. Screener shows FY26 (year to March 2026) sales of only **₹1,075 crore**; but management reported **consolidated revenue of ₹5,049 crore** on the actual results call. Screener's price-to-earnings of 160 and return-on-equity of 10% are calculated off that wrong, low profit — on the real consolidated profit (₹1,082 crore) the price-to-earnings is roughly **23** and return-on-equity about **51%**. **Every operating number in this report is taken from management's consolidated figures on the calls, not from the Screener tables.**

Number (consolidated, FY26)	Value	Plain-English read
Market value of the company	₹24,852 crore	What the whole company is worth on the stock market today (₹359 per share).
Revenue (total sales)	₹5,049 crore	All the money from selling panels and cells in FY26 — more than double last year (up 116%).
Operating profit (EBITDA)	₹1,734 crore	Profit from the core business before interest, tax and wear-and-tear charges — a 34% margin, i.e. 34 paise of every sales rupee. Up 140% on last year.
Net profit (PAT)	₹1,082 crore	The final profit after everything — a 21% margin, up 193% (nearly tripled).
Net debt vs equity	−0.06x	Effectively debt-free — after the IPO it holds slightly more cash than debt. Interest cost is now tiny.
Order book	9.4 gigawatt	Confirmed future orders worth about 12–18 months of production — near-doubled from 4.9 GW a year ago.

2. Concall coverage

Emmvee has held earnings calls only since it listed. **Three calls exist in total and all three were read for this report.**

Quarter	Call date	Transcript read?

Q2 FY26 (Jul–Sep 2025)	2 Dec 2025	Yes — full transcript (Screener)
Q3 FY26 (Oct–Dec 2025)	16 Jan 2026	Yes — full transcript (Screener)
Q4 & full-year FY26 (Jan–Mar 2026)	29 Apr 2026	Yes — web-filled (see note)

Gap handling: The scraper downloaded the first two transcripts but flagged the newest call (the Q4/FY26 results call) as missing — its Screener link was a non-PDF stub. The latest call was therefore **web-filled** from the published transcript and results coverage (AlphaStreet transcript, Saur Energy, and BSE filings) so there is no silent gap on the most recent call. **This is a very short history (three calls, about six months as a listed company), so the "consistency" judgement below is necessarily limited — there simply has not been enough time for a promise to succeed or fail.**

2b. Latest concall highlights — Q4 & FY26 results (call held 29 Apr 2026)

- **Results shot up.** Q4 revenue was **₹1,739 crore** (up 62% on the same quarter last year, and up 51% versus the previous quarter) — meaning sales grew by about half in just three months. Q4 net profit was **₹392 crore** (up 89%). For the full year, revenue **doubled to ₹5,049 crore** and net profit **nearly tripled to ₹1,082 crore**.
- **Margins held up.** Q4 operating margin (EBITDA) was 33% and full-year 34% — i.e. profitability stayed in the same healthy band all year despite prices and raw-material (silver) costs moving around.
- **Biggest update — the big new factory is on track.** The 6 gigawatt integrated cell-and-module plant at Devanahalli (Bengaluru) has land, a ₹3,306 crore loan sanctioned, and construction started; the module part is targeted to start by end-2026 and the cell part by March 2027, taking the company to 16.3 GW of panels and 8.9 GW of cells by FY28. A new step — making the raw wafers/ingots themselves (9 GW, ~₹600–700 crore per GW, first phase around FY29) — was also spelled out.
- **Balance sheet is now very strong.** After using ₹1,621 crore of IPO money to repay loans, the company is effectively debt-free (net debt-to-equity –0.06x); return-on-equity was 51% and return-on-capital 38%.
- **Tone: confident but deliberately "measured."** Management stressed profitable, disciplined growth over growth-at-any-cost and gave **no specific FY27 revenue or profit target**.

2c. Business mix & capacity (quick facts).
• **Domestic vs exports:** Effectively **100% domestic (India) — export orders are zero** right now. Management said its focus "strongly remains on the domestic market," though it is watching openings in Europe/US. Read: all sales are inside India today.
• **Capacity & utilization:** Installed **10.3 GW of panels and 2.94 GW of cells** as of March 2026. Cell plants ran at **~79% in Q4** (up from ~43% a year earlier). Panel plants ran at ~43% for the year — low mainly because two 2.5 GW lines were added mid-year and were not available for the full 12 months. Read: cell lines are nearly full; there is deliberate spare panel capacity to stay ahead of orders.
• **DCR vs non-DCR:** About **30–40% of sales are "DCR"** (Domestic Content Requirement — panels made from Indian cells that qualify for government-scheme projects), the rest non-DCR. Read: roughly a third of the business already serves the higher-value made-in-India segment, which is set to grow.

3. Earning Trigger thesis

The main profit driver management points to is **a large, staged capacity build-out into fully integrated (cell + panel, and later wafer) manufacturing, timed to ride India's push for made-in-India solar**. India's government is progressively requiring solar projects to use Indian-made cells (and later wafers) — the "ALMM" approved-list rules — which favours companies that make their own cells rather than just assembling imported ones. Emmvee is expanding from 7.8 GW of panels (mid-2025) to 10.3 GW today and toward 16.3 GW of panels plus 8.9 GW of cells by FY28, with wafers to follow. The early evidence is strong: revenue doubled in FY26, the order book nearly doubled to 9.4 GW, cell utilization climbed to ~79%, and operating margins held at 34%.

Trigger	What management said	Evidence so far	Time horizon	Strength
Capacity expansion (6 GW integrated plant + more lines)	Reach 16.3 GW panels / 8.9 GW cells by FY28; loan & land secured	Panels 7.8→10.3 GW already added; construction started	FY27–FY28	**Strong** — funded and underway, though most is still to come
Made-in-India / DCR demand (ALMM rules)	Domestic cell & wafer mandates make integrated makers the preferred supplier	Order book 4.9→9.4 GW; 12–18-month visibility; DCR ~30–40% of sales	Now–FY30	**Strong** — policy-backed and already lifting orders
Backward integration to cells (and later wafers)	Own-cell making protects margin; wafers next (9 GW, ~FY29)	Cell margins held 34–36% for a full year; wafer plan announced but not yet committed on timeline	FY27–FY29	**Moderate** — cells proven; wafers still a plan
Margin durability	"EBITDA per watt" stable via pass-through contracts & cost cuts (e.g. silver use down)	34–36% margin across all 3 quarters despite price/ silver swings	Ongoing	**Moderate** — held so far, but industry overcapacity is a real future risk

4. Management Consistency scorecard

Because there are only three calls, this tracks the short list of things management said and whether they followed through — not a multi-year record.

Period	What was promised / said	What actually happened	Verdict
Q2 FY26 (Dec 2025)	Second 2.5 GW panel line to come online in FY26; Sulibele line to stabilise	Second 2.5 GW line commissioned in Q3; capacity reached 10.3 GW	Delivered
Q2 FY26	Repay ~₹1,621 crore debt from IPO; long-term debt down to ~₹50–55 crore by Mar 2026; ~₹35–40 crore/quarter interest saving	Debt repaid; company ended FY26 effectively net-debt-free (–0.06x); finance cost fell to ~₹33 crore/quarter	Delivered
Q2–Q3 FY26	Hold operating margin "broadly around the current band" (~34–36%)	Margin was 35% (Q2), 36% (Q3), 33% (Q4), 34% (full year)	Delivered

Q3 FY26 (Jan 2026)	Cell utilization to reach ~85–90% by year-end; ramping from ~43%	Reached ~79% in Q4 — strong ramp but short of the top of the range	Partly
Q2–Q4 FY26	6 GW integrated plant (FY27) and wafer/ingot backward integration (later)	Land, loan and construction in place; wafer timeline still not committed	Too-early

Narrative drift: Across the three calls the story has been **steady and internally consistent** — same four pillars every call (integrated capacity, made-in-India demand, disciplined balance sheet, margin protection through pass-through contracts). Management has been notably careful not to over-promise: it refuses to give hard revenue/profit targets and repeatedly frames growth as "measured." The one honest caveat is that **six months and three calls is simply too short a window to confirm the story survives a full cycle** — especially the industry-wide overcapacity that management acknowledges exists on paper but says it does not yet feel.

5. Bottom line — two verdicts

Durable earning trigger? → YES

There is a clear, concrete, still-live driver: a funded capacity expansion into integrated cell-and-panel manufacturing, riding India's made-in-India solar mandates. This is not a hope — the evidence is already in the numbers: revenue doubled to ₹5,049 crore, the order book nearly doubled to 9.4 GW with 12–18 months of visibility, cell utilization jumped to ~79%, and margins held at 34%. The biggest genuine risk is future industry overcapacity squeezing prices, but as of the latest call that risk has not shown up in Emmvee's margins.

Management consistent? → MAYBE

On the little they have said so far, management has been impressively consistent and has delivered — the new line, the debt repayment and the margin band all came through, and the four-pillar story has not drifted across three calls. This is not a mixed or contradictory record. The verdict is MAYBE only because the track record is barely six months long: no promise has yet had time to be tested through a downturn, and the multi-year targets (6 GW plant, wafer integration) are still ahead. Give it another 3–4 quarters and this could firmly become a YES.

Sources: Screener.in transcripts for Q2 FY26 (2 Dec 2025) and Q3 FY26 (16 Jan 2026); Q4/FY26 call (29 Apr 2026) web-filled from the published earnings-call transcript (AlphaStreet), Saur Energy results coverage, and BSE corporate filings. Screener standalone financial tables were disregarded in favour of management's consolidated figures, as explained in Section 1.
