Antelopus Selan Energy Ltd

Concall Tracker — Earning Trigger & Management Consistency Review

Formerly Selan Exploration Technology Ltd | Screener ticker: ANTELOPUS | BSE 530075 | Report date: 05 July 2026

1. Snapshot

What the business does: Antelopus Selan Energy is an oil-and-gas producer. It pumps crude oil and natural gas out of on-land fields (mostly in the Cambay Basin in Gujarat) and sells them. In plain terms: it owns oilfields, drills wells, and earns money from the oil and gas it lifts and sells. It has almost no debt.

Number	Value	Plain-English read
Market capitalisation	₹ 2,821 crore	What the whole company is worth on the stock market today — roughly ₹28 billion.
Current share price	₹ 802	One share costs ₹802; it has ranged ₹357–₹934 over the past year.
Sales FY26 (year to Mar-2026)	₹ 279 crore	Total revenue from selling oil and gas last year — up about 8% on FY25's ₹258 crore, and more than 3.5x the ₹77 crore of FY22.
Net profit FY26	₹ 90 crore	The final profit kept after all costs and tax — up about 27% on FY25's ₹74 crore.
Operating margin FY26	57%	Of every ₹100 of sales, about ₹57 is operating profit — a very high margin, because pumping oil from old wells is cheap once they exist.
Return on capital (ROCE)	21.2%	For every ₹100 of capital in the business, it earns about ₹21 a year before tax — healthy.
Borrowings	₹ 4 crore	Almost no debt — the company funds its drilling from its own cash.
Stock P/E	31.5	The share trades at about 31 times last year's profit — the market is pricing in strong future growth, not just today's earnings.

Note: Screener figures above are standalone. Management-reported FY26 total income was ₹287.77 crore and audited profit ₹89.61 crore (up 27%) — the two sets agree closely.

2. Concall coverage

No concall (earnings-call) transcripts were available on Screener for this company — this report is based on a global web deep-dive. As a small oil-and-gas company that only recently became a growth story (after its takeover), it does not appear to host recorded, transcribed quarterly analyst calls that Screener archives. The analysis below therefore draws on the public record instead.

Sources used:

- Company website & investor page (antelopusenergy.com) — corporate presentation (May 2026) and open-offer disclosures.
- FY26 / Q4 FY26 results coverage — ScanX, Trade Brains, EquityBulls, Whalesbook, Business Standard.
- Deal history — MarketScreener, Business Standard (2022 controlling-stake purchase and 2025 reverse-merger completion).
- Independent analysis — Scientific Investing (Substack), "The Oilfield That Finally Breathed".

2b. Latest update highlights — FY26 & Q4 FY26 (results announced May 2026)

- **Best-ever quarter.** Q4 FY26 revenue about ₹104 crore and net profit ₹38 crore — the quarterly profit jumped roughly 139% versus the same quarter a year earlier (₹15.8 crore). In plain terms, the company earned in three months what it used to earn in a year not long ago.
- **Full-year growth.** FY26 profit ₹89.6 crore, up 27%, on total income of about ₹288 crore — the fourth straight year of rising profit.
- **Production still climbing.** Average output reached about 1,760 barrels of oil-equivalent per day in Q4 FY26 (a record) and averaged 1,355 for the full year, up 14%. "Barrels of oil-equivalent per day" = how much oil-and-gas it lifts each day — the core volume that drives sales.
- **Margin held despite weaker oil prices.** Operating margin around 57–59% even though the average selling price fell to about $66 per barrel from $75 the year before — more volume made up for cheaper oil.
- **Still debt-free.** No long-term borrowings as of March 2026 — the growth is being paid for out of the company's own cash.

Tone (from results commentary & presentation): confident and expansion-focused — management is guiding to further volume growth rather than defending the status quo.

2c. Business mix & capacity

Product / geography mix: Almost all revenue today comes from on-land oilfields in the **Cambay Basin, Gujarat** (domestic India sales). Through the merger with Antelopus Energy, the company now also holds a gas-and-oil block in **Assam**, a field in the **KG Basin (Andhra Pradesh)**, and two **offshore exploration blocks** (Mumbai and Mahanadi basins) — four basins in total, up from one. Plain read: today's cash is Gujarat-onshore; the other basins are future upside, not yet producing meaningfully.

Capacity / production headroom: Output rose from ~390 barrels/day in FY22 to a record ~1,760 barrels/day in Q4 FY26. Management targets **2,500 barrels/day in FY27**, fully self-funded with no long-term borrowing. Plain read: the fields have proven reserves barely tapped (less than ~10% extracted historically), so there is a long runway to lift more without buying new assets. Direct pumping cost is only about **$7 per barrel** — roughly a third of the global onshore average — which is why margins stay high.

3. Earning-trigger thesis

The core driver: For ~30 years under the previous owners, Selan sat on proven oil reserves but pumped at "maintenance pace" — reportedly running only about 3 of 20 wells. In 2022 Antelopus Energy (led by petroleum engineer Suniti Kumar Bhat, ex-Chief Operating Officer of Cairn Oil & Gas, and backed by global funds Oaktree Capital and ICE Canyon) took control and switched the strategy from *preserve* to *extract*. The earning trigger is simply **ramping production out of already-proven, low-cost fields** — more barrels sold at ~57% margins from assets that are largely paid for — plus longer-dated upside from the new Assam and offshore blocks.

Trigger	What management says	Evidence so far	Time horizon	Strength
Production ramp of existing Cambay fields	Grow to 2,500 barrels/day in FY27, self-funded, no debt	Output already rose ~390 (FY22) → 1,355 avg / 1,760	Now – FY27	Strong

		peak (FY26). Revenue tripled FY22→FY25.		
Bakrol eastern-flank wells	8 undrilled wells, each targeting ~100–150 barrels/day after stimulation	Part of the record drilling program; contributing to the recent volume rise	Near term (FY26–FY27)	**Moderate**
Duarmara field (Assam gas/oil)	First production, potential ~3,100 barrels/day at 50% ownership, peak FY29–30	Not yet producing; first-oil slipped from FY26 to FY27	FY27 – FY30	**Moderate (unproven, big optionality)**
Offshore blocks (Mumbai, Mahanadi)	Exploration upside	Exploration stage — no reserves booked / no production	Long term	**Weak / speculative**

Verdict on the trigger: There is a real, concrete, still-live earning driver — and unusually, it is *already visibly working* in the numbers, not just promised.

4. Management consistency scorecard

Because there are no transcripts, this compares the public record (deal announcements, presentations and results) across the years since Antelopus took over.

Period	What was promised / expected	What actually happened	Verdict
2022 (takeover)	Turn a sleepy field operator into a growth producer; drill aggressively	Launched the largest-ever drilling program within a year; production and revenue began climbing	**Delivered**
FY22 → FY25	Scale output and revenue from the same proven fields	Revenue tripled (₹77cr → ₹258cr); production ~390 → ~1,100+ barrels/day; margins expanded to 50%+	**Delivered**
FY26	Keep growing volumes, stay debt-free, fund drilling from own cash	Record 1,760 barrels/day (Q4), profit +27%, still zero long-term debt, operating cash > earlier years	**Delivered**
FY26 target	Duarmara (Assam) first production in FY26	Slipped to FY27	**Missed (timeline)**
FY27 guidance	2,500 barrels/day, self-funded	Not yet due — on track given Q4 FY26 already at 1,760	**Too early**

Narrative drift: The story has been remarkably **steady** — the same single message ("extract more from proven, low-cost fields, without debt") has held since 2022, and the reported numbers back it up. The main blemish is the **Duarmara timeline slipping by a year**. Two honest caveats: (1) this is a **short public track record** (real growth only since ~2022), so there are not yet many multi-year promises to grade; and (2) independent commentary flags **related-party transactions and depreciation-policy extensions** as governance items worth watching. On *delivery of the core operational promise*, though, the record is strong and consistent.

5. Bottom line — two verdicts

Durable earning trigger? → YES

There is a clear, concrete, still-live driver: lifting far more oil and gas from already-proven, very-low-cost fields (about $7 per barrel to produce). It is not a hope — revenue tripled in three years, production hit a record ~1,760 barrels/day, and the company does this debt-free while funding its own drilling. A credible FY27 target of 2,500 barrels/day plus untapped Assam and offshore blocks add further runway. The main risk is that earnings swing with the oil price (roughly ₹18–22 crore of revenue per $10 move in Brent), so the driver is real but the profit it throws off is partly outside management's control.

Management consistent? → YES

Since taking control in 2022, the Antelopus team said it would turn a dormant field operator into a growing, debt-free producer — and it has done exactly that, year after year, with the numbers to prove it and no change in the story. That earns a Yes. The honest qualifiers: the public track record is still short, the Duarmara (Assam) start date has already slipped a year, the FY27 volume target is not yet proven, and there are governance items (related-party dealings, depreciation policy) that deserve ongoing scrutiny. None of these amount to a broken promise or a shifting story — so the verdict stays Yes, with eyes open.
