

Antelopus Selan Energy Ltd

Concall-Tracker report · Screener ticker ANTELOPUS · formerly Selan Exploration Technology Ltd · BSE 530075 · continuity update: Q1 FY27 newly read · prepared 31 Aug 2026

1. Snapshot

What the business does (one line): Antelopus Selan Energy is an oil-and-gas producer. It pumps crude oil and natural gas out of on-land fields (mostly the Cambay Basin in Gujarat) and sells them. In plain terms: it owns oilfields, drills wells, and earns money from the oil and gas it lifts — with almost no debt.

Figure	Value	Plain-English read
Market capitalisation	₹2,763 cr (price ₹784)	What the whole company is worth on the stock market today. The share has ranged ₹357–934 over the past year.
Price-to-earnings	19.7× (was 31.5× last quarter)	The share trades at about 20 times the last year's profit. It looks <i>cheaper</i> than three months ago not because the price fell, but because profits grew faster than the price.
Q1 FY27 revenue (Jun'26 qtr)	₹133.1 cr, up 159% YoY	Sales in the June 2026 quarter were about two-and-a-half times the same quarter last year (₹51 cr) and 28% above the March quarter — a record.
Q1 FY27 operating profit (EBITDA)	₹93.2 cr, margin ~70%	Operating profit before interest, tax and depreciation is about 70 paise on every rupee of sales. Pumping oil from old, already-drilled wells is cheap, so margins are unusually high.
Q1 FY27 net profit (PAT)	₹54.3 cr, up 384% YoY / 42% QoQ	Profit after tax. Note the two helpers below — part of this jump came from an accounting change, not from the oilfields.
Trailing 12-month revenue / profit	₹359 cr / ₹133 cr	Sales and profit over the last four quarters, versus ₹279 cr / ₹90 cr for FY26 — the business has grown roughly a third beyond its last full year.
Production (sales volume)	~1,705 boepd, flat QoQ	"Barrels of oil-equivalent per day" is how much oil and gas it sells each day. This was ~1,758 in the March quarter — volumes did not grow this quarter , which matters, because volume growth is the whole investment case.
Return on capital (ROCE)	21.2%; ROE 15.9%	For every ₹100 of capital in the business it earns about ₹21 a year before tax — healthy.
Borrowings	₹4 cr — effectively debt-free	The company still funds its drilling out of its own cash. It also picked up an IND A/Stable credit rating in June 2026.

2. Concall coverage

No concall (earnings-call) transcripts are available on Screener for this company — this report, like the last one, is based on a global web deep-dive. Screener lists 22 investor-communication entries but carries no transcript file for any of them, including the July 2026 one for this quarter. The analysis therefore draws on the company's own results release and corporate presentation plus published coverage of the quarter.

Period	Source date	Coverage
--------	-------------	----------

2022 takeover → FY25	2022 – May 2025	Carried forward from the Q4-2026 report (deal history, annual results, presentations)
FY26 & Q4 FY26	May 2026	Prior report's coverage boundary — carried forward
Q1 FY27 (Jun 2026)	Jul 2026	Newly read in full ★

Sources used this quarter: company Q1 FY27 results release and corporate presentation (antelopuseenergy.com); BSE filing; published Q1 FY27 results coverage (ScanX, IndMoney, Trendlyne); Screener.in financial statements. Because there is no transcript, no management wording is quoted verbatim — only disclosed figures and stated plans.

2b. Latest update highlights — Q1 FY27 (results July 2026) ★

- **Record profit, but the engine changed:** revenue **₹133.1 cr (+28% QoQ)** and profit **₹54.3 cr (+42% QoQ, +384% YoY)**. Management attributed the revenue rise to **stronger commodity prices, not higher volumes** — the opposite of every quarter since the 2022 takeover.
- **Volumes stood still:** average sales volumes **~1,705 boepd** versus ~1,758 boepd in Q4 FY26. The company points to a timing distortion — roughly **6,500 barrels** sat in inventory because of custody-transfer timing (the quarter captured only 86–87 sales days), and it expects that to reverse and flatter Q2 FY27 volumes.
- **Two accounting items lifted reported profit:** an amortisation-policy revision (following the Oil Fields (Regulation and Amendment) Act, 2025) **reduced charges by ₹11.93 cr**, while a **₹10 cr impairment** was taken against work-in-progress at the Elao field pending regulatory approval. Roughly a fifth of the profit growth is therefore accounting, not oil.
- **The near-term catalyst is real and imminent:** at **Bakrol, 9 of 10 planned wells are drilled — ahead of schedule**, and a continuous fracking campaign was due to start in early August, with "full productivity expected to flow through in Q2 FY27". Karjisan's new wells are performing to plan and a development plan for 7 more wells is in final approval.
- **Duarmara (Assam) has still not produced:** re-perforation is now planned "to establish commercial oil flow rates". First oil was originally promised for FY26, moved to FY27, and is still not flowing a quarter into FY27. Elsewhere: two onshore licences won in DSF Bid Round IV (formal award awaited), and a ₹6.56 cr cess refund claim approved.

2c. Business mix & capacity (quick facts)

Product / geography mix: effectively **100% domestic** — crude oil and gas produced from on-land fields in India and sold in India; there are no exports. Almost all of today's cash still comes from the Cambay Basin in Gujarat (Bakrol, Karjisan, Cambay fields). The Assam block (Duarmara), the KG Basin field and two offshore exploration blocks are future upside, not current production.

Field-level run-rates (Q1 FY27): Cambay field ~140–150 boepd from western-side wells; Bakrol is the growth engine mid-campaign; Duarmara contributing nothing yet.

Capacity / production headroom: output went ~390 boepd (FY22) → ~1,355 average / 1,760 peak (FY26) → **~1,705 in Q1 FY27**. Management still targets **2,500 boepd by the end of FY27**, entirely self-funded with no long-term borrowing. Plain read: the fields hold proven reserves that are barely tapped (historically less than ~10% extracted) and direct pumping cost is only about **\$7 per barrel** — a third of the global onshore average — so the runway and the margin are genuine. But to hit 2,500 from 1,705 the company now needs a **steep second-half ramp**, and that rests almost entirely on the Bakrol frac campaign working.

2d. Since our last report ★

Builds on the **Q4-2026 report** (dated 05 Jul 2026, covering FY26 / Q4 FY26 results), which concluded **durable earning trigger → YES** and **management consistent → YES**. One reporting quarter has passed since.

Prior read	What we said then	What the new quarter shows	Movement
Durable earning trigger	YES — ramping output from proven, ~\$7/barrel fields; "already visibly working in the numbers"	Reserves and cost advantage unchanged; Bakrol drilling ahead of schedule. But this is the first quarter where <i>volume did not rise</i>	Intact, unproven this quarter
Management consistency	YES — said it would turn a dormant operator into a growing debt-free producer, and did, year after year	Debt-free upheld and the FY27 target reaffirmed, but the entry base was overstated and Duarmara slipped again	Slipping
Promise to watch: reach 2,500 boepd in FY27, self-funded	Target set; entering FY27 on a stated base of "1,800+ boepd"	Q1 sales averaged 1,705 boepd — below the claimed entry base and flat QoQ. Target reaffirmed, but now needs a steep H2 ramp	Slipping
Promise to watch: Duarmara (Assam) first production	Already slipped once, FY26 → FY27; flagged as the main blemish	Still not producing; re-perforation now required just to establish commercial flow rates. A second slip on the same promise	Slipping
Promise to watch: stay debt-free, fund drilling from own cash	Zero long-term borrowing through FY26	Borrowings still ~₹4 cr; capital programme self-funded; new IND A/ Stable credit rating obtained	Confirmed
Risk to watch: governance — depreciation-policy extensions	Flagged by independent commentary as an item deserving ongoing scrutiny	It recurred: an amortisation revision added ₹11.93 cr to reported profit this quarter. There is a legitimate statutory basis (the 2025 Oil Fields Act), but the pattern is now twice-observed	Slipping
Risk to watch: oil-price sensitivity	~₹18–22 cr of revenue per \$10 move in Brent — profit partly outside management's control	Confirmed in the sharpest way: this quarter's entire revenue growth came from price, with volume flat	Confirmed

Verdict change this quarter: trigger unchanged at YES; consistency downgraded to MAYBE. The asset story is untouched — proven reserves, ~\$7/barrel lifting cost, no debt, and a fracking campaign that is genuinely ahead of schedule on drilling. What changed is the *reliability of the telling*. Three things landed in one quarter: volumes came in below the entry base management had claimed, Duarmara slipped for a second time, and reported profit was helped by ₹11.93 cr of amortisation relief on the very policy line an outside observer had already flagged. Any one of these alone would be noise; together, in the first quarter of the year whose target is the headline promise, they are enough to move consistency off a clean Yes.

3. Earning Trigger thesis ★

The core driver is unchanged: **for roughly 30 years under previous owners, Selan sat on proven oil reserves but pumped at "maintenance pace" — reportedly running only about 3 of 20 wells.** In 2022 Antelope Energy (led by petroleum engineer Suniti Kumar Bhat, ex-Chief Operating Officer of Cairn Oil & Gas, backed by Oaktree Capital and ICE Canyon) took control and switched the strategy from *preserve* to *extract*. The earning trigger is simply **lifting more barrels out of already-proven, very-low-cost fields** — more volume sold at ~70% margins from assets that are largely paid for — with longer-dated upside from Assam and the offshore blocks. That thesis remains sound. The honest change this quarter is that the trigger *paused*: volumes were flat, and the profit record came from price and an accounting revision instead. The next two quarters, when the Bakrol fracs are meant to flow through, are the real test.

Trigger	What management says	Evidence so far	Horizon	Strength	Change since last report
Production ramp of existing Cambay fields	Grow to 2,500 boepd by end-FY27, self-funded, no debt	~390 (FY22) → ~1,760 peak (FY26) → 1,705 in Q1 FY27 — first flat quarter	Now – FY27	Moderate	↓ Weakening — downgraded from Strong; the ramp stalled in Q1
Bakrol frac campaign	10 development wells; continuous fracking from early Aug 2026; full productivity in Q2 FY27	9 of 10 wells drilled, ahead of schedule — but no production uplift booked yet	Q2–Q3 FY27	Strong	↑ Improving — drilling ahead of plan; this is now the key near-term catalyst
Karjisan new wells	New wells performing as expected; plan for 7 more in final approval	On plan; approval pending	FY27–FY28	Moderate	↑ Improving — newly disclosed pipeline of wells
Low-cost, high-margin production	~\$7/barrel direct lifting cost sustains ~57–70% operating margins	Q1 FY27 operating margin ~ 70% , the highest yet	Structural	Strong	↑ Improving — margin at a record
Duarmara field (Assam gas/oil)	First production, potential ~3,100 boepd at 50% ownership, peak FY29–30	Still not producing; re-perforation planned to establish flow. Slipped FY26 → FY27 → still pending	FY27–FY30	Unproven	↓ Weakening — a second timeline slip
New acreage (DSF Round IV, offshore blocks)	Two onshore licences won; Mumbai and Mahanadi offshore blocks as exploration upside	Awards awaited; no reserves booked, no production	Long term	Speculative	↑ Slightly — two new licences added to the option pool
Oil price (not management-controlled)	Not guided — acknowledged as a swing factor	FY26 realisation ~\$66/boe vs ~\$75 in FY25; stronger prices drove <i>all</i> of Q1 FY27's revenue growth	Ongoing	Outside control	Unchanged — but its influence was unusually visible this quarter

4. Management Consistency scorecard

There are no transcripts, so this grades the public record — deal announcements, presentations and results — across the years since Antelopus took over.

Period	What was promised / expected	What actually happened	Verdict
2022 (takeover)	Turn a sleepy field operator into a growth producer; drill aggressively	Launched the largest-ever drilling programme within a year; production and revenue began climbing	Delivered

FY22 → FY25	Scale output and revenue from the same proven fields	Revenue tripled (₹77 cr → ₹258 cr); production ~390 → ~1,100 boepd; margins expanded past 50%	Delivered
FY26	Keep growing volumes, stay debt-free, fund drilling from own cash	Record 1,760 boepd in Q4, profit +27%, zero long-term debt	Delivered
FY26 target	Duarmara (Assam) first production in FY26	Slipped to FY27	Missed (timeline)
FY27 (restated)	Duarmara first production during FY27	Still not flowing at end-Q1; re-perforation now needed to establish commercial rates	Slipping again
Entering FY27	Base of "1,800+ boepd" with a road map to 2,500+	Q1 FY27 sales averaged 1,705 boepd — below the stated base, and flat versus Q4	Missed
FY27 guidance	2,500 boepd by year-end, entirely self-funded	Reaffirmed; not yet due, but now requires a steep H2 ramp off a flat Q1	Too early
Ongoing	Remain debt-free	Borrowings ~₹4 cr; capital programme self-funded; IND A/Stable rating obtained Jun 2026	Delivered
Governance (flagged)	Depreciation / amortisation policy previously questioned by outside commentary	An amortisation revision added ₹11.93 cr to Q1 FY27 profit — statutorily grounded in the 2025 Oil Fields Act, but the second such instance	Watch

Narrative drift: The *message* has not drifted at all — "extract more from proven, low-cost fields, without debt" has held unchanged since 2022, and on the balance sheet they have honoured it completely. The drift is in the gap between the operational claims and the reported quarter. Three separate items pulled the same direction this time: an entry-base figure (1,800+ boepd) that the first quarter did not support, a Duarmara start date that has now moved twice, and a profit number helped by ₹11.93 cr of amortisation relief on precisely the accounting line an independent analyst had already flagged as worth watching. None of these is a broken promise on the core strategy, and each has a defensible explanation — custody-transfer timing for volumes, subsurface reality for Duarmara, a new statute for the amortisation. But a track record is graded on the pattern, and the pattern this quarter is of a company presenting a stronger picture than the underlying operations delivered. Two standing caveats also remain from last time: the public record is still **short** (real growth only since ~2022), and related-party transactions deserve continued scrutiny. Tone remains confident and expansion-focused.

5. Bottom line — two verdicts

Durable earning trigger? → YES vs last quarter: unchanged

Nothing this quarter damaged the asset. The driver is still concrete and still live: proven reserves in fields that have historically given up less than ~10% of their oil, a direct lifting cost near \$7 a barrel that produced a record ~70% operating margin, no debt, and a drilling programme that is *ahead* of schedule — 9 of 10 Bakrol wells down, with the fracking campaign that converts them into barrels starting in August. What the quarter did do is remove the easy proof. For three years the trigger was visible in rising volumes every quarter; this quarter volumes were flat and the record profit came from oil prices and an accounting revision instead. The company's explanation — 6,500 barrels stuck in inventory on custody-transfer timing, reversing into Q2 — is plausible and checkable within one quarter. So the verdict stays Yes, but it is now a Yes that has to be re-earned in Q2 FY27: if the Bakrol fracs flow and volumes step up toward 2,500 boepd, the trigger is confirmed; if volumes are flat again, this stops being a ramp story and becomes an oil-price story.

Management consistent? → MAYBE vs last quarter: downgraded from YES

What moved it: three items in a single quarter, all pointing the same way. Management entered FY27 telling the market the base was "1,800+ boepd"; the quarter delivered 1,705 and no growth. Duarmara's first production, already pushed from FY26 to FY27, has now slipped a second time and needs re-perforation merely to establish whether it flows commercially. And reported profit was lifted by ₹11.93 cr from an amortisation-policy revision — legitimately grounded in the 2025 Oil Fields Act, but landing on the exact governance line the previous report had flagged for scrutiny. Set against that, the things they promised on the balance sheet they have delivered without exception: still debt-free, still self-funding the drilling, now with an investment-grade rating, and the FY27 target reaffirmed rather than quietly dropped. That is why this is a Maybe and not a No — the strategy has never wavered and the core operational promise has been delivered every year since 2022. But the record is no longer clean, the public track record is still short, and the burden of proof has shifted back to management for the next two quarters.

Prepared from public sources on 31 Aug 2026 — company Q1 FY27 results release and corporate presentation, BSE filings, published results coverage, and Screener.in financial statements; the pre-FY27 record is carried forward from the Q4-2026 report of 05 Jul 2026. No earnings-call transcripts exist for this company on Screener, so no management wording is quoted verbatim. Oil-and-gas earnings are commodity-price sensitive; figures beyond Q1 FY27 are management targets, not guarantees. **This is not investment advice. Do your own due diligence.**
