Antelopus Selan Energy Ltd

Concall Tracker · Q2 FY2027 (quarter ended 30 Sep 2026) · Screener: ANTELOPUS · BSE: 530075 · formerly Selan Exploration Technology Ltd · Report prepared 6 Nov 2026

Continuity report · follows our Q1-2027 report

Not investment advice. Do your own due diligence. A reading of the company's own earnings-call transcript and public financials. Oil-and-gas profits swing with oil prices, which nobody controls.

1. Snapshot

What the business does: Antelopus Selan pumps crude oil and gas out of old onshore fields, mostly in Gujarat's Cambay Basin, and sells it to Indian refiners, mainly Indian Oil. Since a new team took over in 2022 it has gone from running a few wells at a slow pace to drilling hard into proven, barely-tapped reserves. It carries no debt and pays for its drilling out of its own cash.

Measure	Value	What it means in plain words
Market cap	₹3,141 cr	What the whole company is worth on the stock market. Up from ₹2,763 cr at our last report.
Q2 FY27 revenue	₹121.7 cr	Sales in the Sept quarter. About double last year, but down from ₹133 cr in Q1 because oil prices dipped in July and August and volumes didn't grow.
Q2 FY27 EBITDA	₹90 cr (₹83 cr ex one-off)	Operating profit before interest, tax and depreciation. Includes a ₹6.5 cr cess refund. Without it the margin is about 69%, so roughly ₹69 of every ₹100 of sales is operating profit. Very high, because the wells are cheap to run.
Q2 FY27 net profit	₹57.3 cr	Nearly five times the ₹11.8 cr of a year ago. A little above Q1's ₹54 cr.
Average output (H1)	~1,700 boepd	Barrels of oil-equivalent sold per day. Flat for a second quarter. October was already near 2,000, which is the first sign of the new wells kicking in.
Balance sheet	No debt, ~₹100 cr cash	Equity of about ₹780 cr. Still paying for growth from its own pocket.
Stock P/E	16.9×	The share trades at about 17 times the last year's profit. Cheap next to most growth stories, but oil profits deserve a lower multiple because prices swing.

2. Concall coverage

Period	Source date	How it is treated
2022 takeover → Q4 FY26	2022 – May 2026	Carried forward from the Q4-2026 report (web deep-dive: results, presentations, filings).
Q1 FY27 (prior boundary)	Jul 2026 results	Coverage boundary of the Q1-2027 report, also a web deep-dive. No call was held.
Q2 FY27, the company's first earnings call	26 Oct 2026	Newly deep-read in full ★

This is the first time we can read management in its own words. Earlier reports had no transcript at all and worked from releases and news. Screener lists one transcript and it downloaded cleanly. Management promised to hold a call every quarter from now on, which will make the consistency read much sharper. With only one call, it's still limited for now.

★ Latest concall highlights · Q2 FY27 (first earnings call, 26 Oct 2026)

- **Profit held up while oil prices dipped.** Realised oil price fell from $95.3 to $88.2 a barrel, yet net profit edged up to ₹57.3 cr. Operating costs fell to ₹6.1 cr from ₹7.5 cr. Read: most of the cost base is fixed, so the business keeps its margin even when prices slip.
- **Volumes were flat again, and they owned it.** Bakrol's fracking ran late because of supply-chain snags and older Karjisan wells declined. Management called it a "temporary blip". October output was already about 2,000 boepd, against ~1,700 average for the half. Read: the ramp is visible now, but a quarter later than promised.
- **A bigger target, spelled out for the first time.** 2,500 boepd exit for FY27 reaffirmed, then ~3,500 for FY28 and 5,000 by FY29, all from onshore fields with "very minimal" help from the new blocks. Capex this year about ₹250 cr.
- **New acreage signed.** Revenue-sharing contracts from the government's DSF-IV bid round were signed on 22 Oct: seven new discoveries in KG onshore plus fields next to Bakrol in Gujarat. Management thinks KG onshore may hold more resource than its offshore blocks. But KG wells cost roughly $10 m each against $1.5 m in Cambay, and funding (cash, debt or new equity) is "too early to say".
- **Duarmara (Assam) is still not producing.** The well found oil where they expected gas. A plan comes in five to six months, with real estimates only next fiscal. About ₹100 cr already sits in work-in-progress for it.

Business mix & capacity (Q2 FY27). Domestic vs export: 100% domestic. Oil is sold in India at roughly a 10% discount to Brent, mostly to Indian Oil, with about a fifth going to private buyers at a slightly bigger discount. **Fields:** Bakrol is the backbone at about 950 boepd in October after its 10-well campaign; Karjisan is drilling seven new wells this fiscal and each of its barrels earns about twice a Bakrol barrel because government levies there are tiny. **Capacity:** oilfields don't have "utilisation" like a factory. The useful headroom figure is that the company has historically pulled out only a small share of its proven reserves, and the jump from ~1,700 to the 2,500 exit target needs the Karjisan wells to land in the next five months.

★ Since our last report

Builds on the Q1-2027 report (results of Jul 2026, no call). Its verdicts were **trigger YES** and **consistency MAYBE** (downgraded from YES). Promises to watch: Bakrol fracking at full productivity in Q2, 2,500 boepd by end-FY27, Duarmara first production, staying debt-free, and the accounting changes that had padded profit.

Prior read	What we said then	What the new call shows	Movement
Bakrol full productivity in Q2	Fracking from early August, full uplift in Q2.	Fracking ran late. Done now, Bakrol ~950 boepd in October. Uplift lands in Q3, not Q2.	**Slipping**
Inventory reversal to lift Q2 volumes	~6,500 barrels held back in Q1 should show up in Q2 sales.	Not called out on the call. Half-year sales still averaged ~1,700 boepd.	Unclear
2,500 boepd exit FY27	Needs a steep second-half ramp.	Reaffirmed, "pretty confident". October ~2,000. New FY28 and FY29 targets added.	On-track
Duarmara first oil	Slipped FY26 → FY27, now needs re-perforation.	Oil seen twice in the well but no plan yet; estimates only next fiscal. A third slip.	**Slipping**
Debt-free, self-funded	Confirmed.	Still no debt. But KG funding is left open, with debt or a capital raise not ruled out.	Confirmed, with a caveat
Accounting help to profit	Amortisation revision added to Q1 profit.	No new policy change. The only one-off this time, the ₹6.5 cr refund, was flagged upfront by the CFO.	**Improving**
Transparency	No calls; record graded from releases only.	First earnings call held, quarterly calls promised.	**Improving**

Verdict change this quarter: both unchanged. The trigger stays YES: the cost advantage held through a price dip and October output shows the new wells working. Consistency stays MAYBE: the Q2 volume promise slipped a quarter and Duarmara slipped again, but management was upfront about both and about the one-off in the numbers, which is better behaviour than last quarter.

★ 3. Earning-trigger thesis

The driver is simple and hasn't changed: pull more oil out of proven, cheap-to-run Gujarat fields that the old owners barely touched. Most costs are fixed, so each extra barrel adds almost straight to profit, which is why the margin holds near 70%. Production has gone from about 511 boepd in FY23 to about 1,355 in FY26, and October 2026 sat near 2,000. Management now commits to 5,000 boepd by FY29 from onshore fields alone. The longer-dated kicker is the new KG onshore acreage, but that's a different, much costlier game and nothing in it is proven yet. The near-term test is clear: does output reach 2,500 by March.

Trigger	What management said	Evidence so far	Time horizon	Strength	Change since last report
Cambay ramp (Bakrol + Karjisan)	2,500 exit FY27; 3,500 FY28; 5,000 FY29.	Bakrol campaign done (~950 boepd); October ~2,000 total; two Karjisan wells drilled.	Now – FY29	Strong. Years of delivery, a quarter late this time.	↑ **new wells now flowing**
Low fixed costs	70–75% of costs fixed; extra barrels cost ~$1–1.5.	Opex fell while revenue doubled; ~69% margin ex one-off.	Structural	Strong	**unchanged**
Karjisan fiscal edge	Levies under 5% vs ~30% elsewhere; seven wells this fiscal.	Wells drilled, not yet producing.	Q3–Q4 FY27	Moderate	↑ **newly quantified**
KG onshore (DSF-IV)	Seven new discoveries; resource maybe above offshore; one-rig start.	Contracts signed 22 Oct. No reserves booked, no plan or capex yet.	FY28+	Speculative	↑ **signed, not proven**
Duarmara (Assam)	Oil found; plan in five to six months.	No production; ~₹100 cr parked in work-in-progress.	FY28+	Unproven	↓ **slipped again**
Oil price	"No control"; projects must pay back at $50.	Realisation fell from $95 to $88; profit still rose.	Ongoing	Outside control	**unchanged**

4. Management consistency scorecard

Period	What was promised	What actually happened	Verdict
2022 – FY26 (carried fwd)	Turn a sleepy operator into a growing producer, debt-free.	~511 boepd (FY23) → ~1,355 (FY26); no debt.	Delivered
FY26 → FY27	Duarmara first production in FY26, then FY27.	Still not producing; estimates next fiscal.	Missed (twice)
Entering FY27	Base of "1,800+ boepd".	Q1 ~1,705; H1 ~1,700.	Missed
Q1 FY27 (Jul 26)	Bakrol fracking at full productivity in Q2.	Delayed; showing from October.	Partly (late)
Ongoing	Stay debt-free, self-fund drilling.	No debt, ~₹100 cr cash.	Delivered
Q2 FY27 (Oct 26)	2,500 exit FY27; 3,500 FY28; 5,000 FY29; quarterly calls.	Forward-looking.	Too early

Narrative drift: the core story hasn't moved since 2022: find out what's underground, drill it carefully, plough the cash back in, no debt. What did shift is scope. The company now talks of KG onshore as its next big hub and openly leaves room for borrowing or raising equity to fund it, which is new. That's a sensible evolution, not drift, but it's a different risk profile from the self-funded Cambay story. On timing, the record is weaker: the Q2 volume step-up and Duarmara both slipped. On candour, the first call scored well. The MD and CFO named the volume shortfall, the one-off refund and the KG cost gap without being pushed, and refused to be talked into a bigger production number than 5,000.

5. Bottom line · two verdicts

Durable earning trigger? → YES

vs last quarter: unchanged

The trigger was under question last quarter because volumes had stalled. They stalled again in Q2, but for a stated and now-fixed reason: fracking ran late. October output near 2,000 boepd, with Bakrol's new wells flowing and Karjisan's about to start, is the first hard sign the ramp has resumed. The cost structure proved itself too: profit rose even as the oil price fell. The risks are real. Oil prices drive a large part of the profit and nobody controls them, and the bigger long-term plans in KG need far costlier wells and maybe outside money. But the near-term driver, more barrels from cheap Gujarat fields, is concrete and live.

Management consistent? → MAYBE

vs last quarter: unchanged

Nothing moved it up or down on balance. Against them: a second straight quarter of flat volumes after Q2 was meant to show the uplift, and a third delay on Duarmara. For them: they've delivered the multi-year production climb, the balance sheet promise has never wavered, and the first earnings call was frank about the misses and the one-off. They also volunteered a hard, checkable target ladder (2,500 / 3,500 / 5,000). If the FY27 exit lands near 2,500 this goes back to YES; if it falls well short, the ramp story starts to look like an oil-price story.

Sources: Antelopus Selan Energy Ltd Q2 FY27 earnings-call transcript (the company's first, call 26 Oct 2026, filed 2 Nov 2026), sourced from Screener.in and read in full. Earlier history carried forward from our Q4-2026 and Q1-2027 reports (web deep-dives of results, presentations and filings). Screener.in financials as at 6 Nov 2026; Screener shows Q2 sales of ₹119 cr and net profit of ₹57 cr on its own basis. Production figures are management's as stated on the call.
