Shri Jagdamba Polymers Ltd

Concall tracker, filed under Q2 2027 (results for the quarter to 30 Sep 2026). Prepared 11 Nov 2026.

1. Snapshot

An Ahmedabad company, started in 1985, that weaves polypropylene (PP, a common plastic) into technical fabrics: woven geotextiles used under roads and embankments, silt fences, roofing underlay, house wrap, lumber wrap, tarpaulins, and woven bags and pallet covers. It sells much of this abroad. It buys plastic granules at market prices and earns the spread between those and its fabric prices.

Number	Value	Plain read
Market cap	about ₹690 cr	A small company by market value.
Sales, last 12 months	about ₹510 cr	Only a little above FY25's ₹481 cr: a weak FY26 followed by a very strong first half of FY27.
Net profit, last 12 months	about ₹54 cr	Above FY25's ₹48 cr. The last two quarters made ₹36 cr.
Operating margin	16% in Jun and Sep 2026 quarters	Back up from 6% and 9% in the two quarters before. It has swung between 11% and 23% over the last decade.
P/E (price to earnings)	about 13x	Cheap on today's profit, which itself may be at a high point.
Borrowings	₹57 cr standalone	Modest against about ₹368 cr of shareholder funds.
Debtor days	about 100 in FY26	Customers take over three months to pay, up from around 50 a decade ago. Receivables rose again to ₹168 cr in Sep 2026.
Promoter holding	72.9%	High and unchanged for years.

2. Coverage

No concall transcripts were available on Screener, and the company has not held earnings calls. This report is based on a global web deep-dive. Sources used: Screener.in financials (standalone); third-party summaries of the company's H1 FY27 results presentation and Q2 FY27 results (multibagg.ai, 7 Nov 2026); Whalesbook coverage of FY26 results (19 May 2026); Kotak Neo and stockanalysis.com result pages; company profile data from stockanalysis.com and Tofler; a note on Screener that the shares were admitted to trade on NSE from Aug 2026. No original management quotes were found, so management's statements below are paraphrases from those summaries.

Latest update highlights: Q2 FY27 / H1 FY27 (results and presentation, early Nov 2026)

- Standalone sales ₹165 cr in the Sep quarter, up about half on a year ago; profit ₹17 cr. Consolidated profit roughly tripled on a weak base.
- H1 FY27 standalone profit up 54% to about ₹36 cr on sales up 38%. In plain terms, the first half was the best in the company's history.
- The company's own reasons, as reported: polymer supply got tight after the Iran war, it had bought raw material well and kept lines running when rivals ran short, it passed higher prices through, and it sold older, cheaper inventory at the new prices. Plants ran at about 95%.
- Risks it named itself: polymer prices, container freight (which it said rose about fourfold), currency and global trade.
- Receivables and inventory both jumped from March, and net debt rose.

Business mix and capacity
Domestic/export split not broken out in any source found; the company is known as an exporter, but no share is disclosed.
Capacity utilisation about 95% in both quarters of H1 FY27 (presentation summary). Installed capacity and any expansion plan not disclosed. With plants this full, more volume would need new capacity.

3. Earning trigger thesis

There's no new plant, product or contract behind the jump. The first half of FY27 was a supply shock: polymer got scarce, Shri Jagdamba had material when others didn't, and it earned extra on cheaper old stock. That's good buying, not a lasting driver. FY26 shows the other side of the cycle: sales fell, margins dropped to single digits in two quarters, and a loss-making subsidiary (Global Polyweave) dragged on group profit. One-time items (an interest refund and an insurance claim, about ₹9.6 cr together) also flattered FY26.

Trigger	What the company said	Evidence so far	Time horizon	Strength
Polymer shortage windfall	Extra orders filled during shortages, higher prices passed on, cheap inventory sold (H1 FY27 presentation, as summarised)	Margin back to 16%, profit records in two quarters	As long as supply stays tight	**Weak** as a durable driver, by its own description it's a market condition
Full plants	About 95% utilisation	Sales up in both quarters	Now	**Unproven**, no expansion announced to grow beyond it

3b. Trigger check

Trigger type	Yes/ No	What was said (date)
Debt cut	No	Net debt rose in H1 FY27
New business	No	Not mentioned
Margin up	Yes	Higher delivered prices and cheaper inventory lifted margins (H1 FY27 presentation, Nov 2026, as summarised)
New management	No	Not mentioned
New capacity	No	Not mentioned
Big orders	No	Extra orders during shortages, but no order book disclosed
Turnaround	No	Not framed as one
Promoter buying	No	Promoter stake unchanged at 72.9%

Single concrete driver: a polymer shortage that let it sell more, at higher prices, from cheaper stock it had already bought.

3c. Margin bridge

Operating margin is 16% now against 16% a year ago but 6-9% in the two quarters between, so the recovery is from a slump, not a new high. The lift came from passing higher polymer prices to buyers and selling inventory bought earlier at lower cost. That second part reverses when prices settle. **(one-off)**

4. Management consistency scorecard

There are no concalls and no stated targets in the sources found, so there's no promised-vs-delivered record to score. What the numbers show:

Period	What was promised	What actually happened	Verdict
FY25	No public guidance	Sales up a third, profit at a record	Too-early
FY26	No public guidance	Sales down 14%, consolidated profit down about a quarter, propped by one-time gains	Too-early
H1 FY27	Presentation explains the jump as shortage-driven and lists its own risks	Record half	Too-early

Narrative drift: nothing to drift from. The one piece of commentary found is candid: it credits the market, not a new strategy, and names the risks. That's to its credit. The weak spots are the rising receivables, the loss-making subsidiary, and the absence of any forward plan.

5. Bottom line

Durable earning trigger? → NO

The record half came from a polymer squeeze and inventory gains. Nothing named (a plant, a product, a customer) carries it forward once supply normalises.

Management consistent? → MAYBE

No calls and no targets, so there's nothing to hold them to. The commentary that exists is honest about why profit jumped, but slow-paying customers and a subsidiary losing money show up without explanation.

6. Checkpoints for next quarter

- Operating margin stays near the H1 FY27 level as polymer prices settle
- Receivables come down from the Sep 2026 level
- Subsidiary Global Polyweave's loss narrows
