

Emmvee Photovoltaic Power Ltd

Concall Tracker report | Screener ticker: EMMVEE (NSE/BSE 544608) | Q1 FY27 update | Prepared 24 July 2026

Reading the earnings conference calls ("concalls") to judge two things: (1) is there a real, durable driver of future profit, and (2) has management said consistent things call-to-call and delivered on them? This is a continuity update that builds on our Q4-2026 report and deep-reads only the new Q1 FY27 call.

1. Snapshot

What the business does: Emmvee is a Bengaluru company (in solar since 1992) that manufactures solar panels ("modules") and the solar cells that go inside them. Solar cells are the small squares that turn sunlight into electricity; modules are the finished panels sold to power producers. Emmvee makes money by selling these panels and cells, mostly to large Indian renewable-power developers. It listed on the stock market in November 2025, so its life as a public company is still under a year old.

Important data note — read this first. The free Screener.in financial tables for Emmvee are **standalone and badly under-count the group**. Screener currently shows a price-to-earnings of 224 and return-on-equity of ~10%, both calculated off a wrong, low standalone profit. On the real **consolidated** FY26 profit of ₹1,082 crore, the price-to-earnings is roughly **21** and return-on-equity about **51%**. Every operating number in this report is taken from management's consolidated figures on the calls, not the Screener tables.

Number	Value	Plain-English read
Market value of the company	₹22,924 crore	What the whole company is worth on the stock market today (₹331 per share, down from ₹359 at our last report).
Revenue — Q1 FY27 (quarter to Jun 2026)	₹1,555 crore	Sales in the latest quarter — up 51% on the same quarter last year, though down from the seasonally strong ₹1,739 crore of the prior quarter.
Operating profit (EBITDA) — Q1 FY27	₹548 crore	Core-business profit before interest, tax and wear-and-tear — a 35% margin (35 paise of every sales rupee), up 56% year-on-year and slightly better than last quarter's 33%.
Net profit (PAT) — Q1 FY27	₹380 crore	The final profit after everything — a 24% margin, more than doubled (up 103%) on last year, helped by a big drop in interest cost.
Full-year FY26 (for context)	Rev ₹5,049 cr / PAT ₹1,082 cr	Last full year: revenue doubled and profit nearly tripled. FY27 has started ahead of that pace.
Net debt vs equity	≈ debt-free	After using IPO money to repay loans, interest cost fell to just ₹11 crore this quarter (from ₹53 crore a year ago).
Order book	9.9 gigawatt	Confirmed future orders — up from 9.4 GW at end-FY26 — roughly 12–18 months of production visibility.

2. Concall coverage

Emmvee has held earnings calls only since it listed. Four calls now exist; the first three were covered in our previous report and only the newest (Q1 FY27) is deep-read in full this quarter.

Quarter	Call date	Coverage
Q2 FY26 → Q4/FY26 (3 calls)	Dec 2025 – 29 Apr 2026	Carried forward from the Q4-2026 report (read in full there)
Q4 & full-year FY26 (boundary call)	29 Apr 2026	Prior coverage boundary — backstory only
Q1 FY27 (Apr–Jun 2026)	16 Jul 2026	Newly deep-read in full ★

Only the Q1 FY27 call was read in full this quarter; the earlier three quarters are carried forward as backstory from the prior report. This remains a very short history (four calls, ~9 months as a listed company), so the consistency read is still limited by time — but the record now has one more quarter of delivery behind it.

2b. Latest concall highlights — Q1 FY27 (call held 16 July 2026)

- **Best quarter yet on profit, sales dipped sequentially.** Revenue ₹1,555 crore (up 51% year-on-year) but down about 11% from the prior quarter; management said some non-DCR orders slipped into this quarter because of letter-of-credit timing and rains at project sites. Crucially, operating profit fell only 4% quarter-on-quarter and net profit hit a record ₹380 crore (up 103%) — read: profit quality held up even as top-line dipped.
- **Margins improved, not just held.** Operating margin rose to 35% (from 33% last quarter), driven by a richer sales mix — DCR (made-in-India) sales crossed 50% of the quarter, up from the earlier 30–40% — and more in-house cell use. Read: the more valuable made-in-India business is now the bigger half.
- **First-ever hard guidance.** Management for the first time put a number on the year: **~₹2,400 crore of EBITDA (operating profit) by the close of FY27** — that would be about 38% above FY26's ₹1,734 crore. A clear break from its earlier refusal to give targets.
- **Big factory still on track.** The 6 GW integrated cell-and-module plant is progressing to plan — module line by December 2026, cell line by March 2027; total cost ~₹5,500 crore, ₹3,300 crore debt tied up at under 8%, all major equipment ordered and 60% of hard-cost orders placed. Takes the company to ~16.3 GW modules / 8.9 GW cells by end-FY27.
- **Policy tailwind now live.** The government's ALMM List 2 (which forces covered projects to use Indian-made cells) took effect from June 2026 — management expects domestic-content (DCR) demand to strengthen through FY27 and positions Emmvee, an established TOPCon cell maker, as a preferred supplier.
- **Tone: confident, still disciplined.** "Best quarter so far," record module and cell output, but management stuck to its "reasonable margin over maximum utilization" philosophy and flagged it is holding extra raw-material inventory as a hedge against geopolitical/silver-supply risk.

2c. Business mix & capacity (quick facts)

- **Domestic vs exports:** Focus remains domestic (India); management did not cite any export sales this quarter (exports were zero at the last call). Read: essentially all sales are inside India today.
- **DCR vs non-DCR:** DCR (made-in-India cells that qualify for government-scheme and, now, ALMM-covered projects) crossed **50% of sales**, up from ~30–40% previously — and DCR is

now the majority of the order book too. Read: the higher-margin made-in-India segment has become the larger half of the business.

- **Capacity & utilization:** Installed 10.3 GW of modules and 2.94 GW of cells (unchanged). Cell plants ran at **83%** (up from 79% last quarter, near the ~85–90% peak); module plants at 45% (peak ~65%, deliberate spare kept to stay ahead of orders). Both module (970 MW) and cell (454 MW) output were record highs. Read: cell lines are nearly full; module lines hold room to grow.
- **New income stream:** Merchant cell sales (selling cells to others, not just building them into own modules) reached their highest-ever level — a "meaningful" contributor this quarter.

2d. Since our last report ★

This builds on the **Q4-2026 report** (boundary call 29 Apr 2026), which carried two verdicts: **Durable trigger — YES** and **Management consistent — MAYBE**. Here is how those have aged one quarter on:

Prior read / promise to watch	What we said then	What the Q1 FY27 call shows	Movement
Durable earning trigger	Funded integrated-capacity build-out riding made-in-India demand — YES	Order book 9.4→9.9 GW, cell utilization 79→83%, DCR mix >50%, margin 35%; ALMM List 2 now in force	Confirmed
Management consistency	Delivered so far but only 3 calls — MAYBE	Fourth call; margin band and cost discipline held again, and for the first time a concrete EBITDA target was given	Improving
6 GW integrated plant (module end-2026, cell Mar-2027)	Land + loan secured, construction started	On schedule; all major equipment ordered, 60% of hard-cost orders placed, debt fully tied up	On-track
Cell utilization to ~85–90%	Reached 79% (short of target)	Reached 83% — closing in on the 85–90% peak	Improving
Wafer/ingot backward integration (was "9 GW, ~FY29, timeline uncommitted")	Announced but not committed	Now phased: 5 GW in FY29 + 4 GW in FY30, commissioning mid-CY2028, funded from internal accruals (subject to ALMM List 3)	Improving
No FY27 revenue/profit target given	Management refused hard guidance	Gave first-ever hard number: ~₹2,400 crore EBITDA by end-FY27	Improving

Verdict change this quarter: The **trigger verdict stays YES** — the driver is not just intact but visibly playing out (order book, margins, cell utilization and DCR mix all moved the right way, with the ALMM policy tailwind now legally live). The **consistency verdict stays MAYBE but is clearly strengthening toward YES**: management delivered again and, importantly, gave its first concrete target — a positive transparency signal that itself now needs to be delivered before the verdict can be upgraded.

3. Earning Trigger thesis

The main profit driver management points to is a **large, staged capacity build-out into fully integrated (cell + panel, and later wafer) manufacturing, timed to ride India's push for made-in-India solar**. India's government is progressively requiring solar projects to use Indian-made cells (and later wafers) — the "ALMM" approved-list rules, whose **List 2 took effect from June 2026** — which favours companies that make their own cells rather than assembling imported ones. Emmvee is expanding toward 16.3 GW of panels plus 8.9 GW of cells by end-FY27, with wafers to follow. The evidence keeps building: revenue up 51% year-on-year, order book 9.4→9.9 GW, cell utilization 79→83%, DCR mix now >50%, margins up to 35%, and — for the first time — a concrete ₹2,400 crore EBITDA target for the year.

Trigger	What management said	Evidence so far	Time horizon	Strength	Change since last report
Capacity expansion (6 GW integrated plant + more lines)	Reach 16.3 GW panels / 8.9 GW cells by end-FY27; loan & land secured, equipment ordered	All major equipment ordered, 60% of hard-cost orders placed, ₹3,300 cr debt tied up; still 10.3 GW today	FY27–FY28	Strong — funded, on schedule, execution visibly advancing	↑ improving — moved from "construction started" to "equipment ordered, 60% placed"
Made-in-India / DCR demand (ALMM rules)	Domestic cell mandates make integrated makers the preferred supplier; ALMM List 2 live from Jun-2026	DCR crossed 50% of sales (from 30–40%); order book DCR-majority; order book 9.4→9.9 GW	Now–FY30	Strong — policy now legally in force and already lifting the mix	↑ improving — the policy is no longer pending; it is live and moving the numbers
Backward integration to cells (and later wafers)	Own-cell making protects margin; wafers next — 9 GW, 5 GW FY29 + 4 GW FY30	Cell utilization 83%; merchant cell sales at record; wafer plan now phased with a mid-CY2028 commissioning line-of-sight	FY27–FY30	Moderate — cells proven and scaling; wafers now planned in detail but still uncommitted spend	↑ improving — wafer plan went from vague to phased with dates
Margin durability	Stable "EBITDA per watt" via order-backed procurement, dollar-based pricing and richer DCR mix	Margin 35% (Q1) vs 33% (Q4); EBITDA/watt stable (~₹2–2.5 module, ₹6–6.5 cell, ₹8.5–9 DCR module)	Ongoing	Moderate — held and improved, but non-DCR module market is tightening and overcapacity is a real future risk	unchanged — still holding; one analyst flagged possible non-DCR module margin pressure ahead

4. Management Consistency scorecard

With four calls now on record, this tracks what management said and whether they followed through — still a short window, not a multi-year record.

Period	What was promised / said	What actually happened	Verdict
Q2–Q4 FY26 (carried forward)	Commission second 2.5 GW line; repay ~₹1,621 cr IPO debt; hold margin ~34–36%	All delivered — capacity reached 10.3 GW, company effectively debt-free, margins held	Delivered
Q3 FY26 → Q1 FY27	Cell utilization to reach ~85–90% (was ramping from 43%)	79% (Q4) → 83% (Q1) — steady climb, now close to the target band	Partly (on track)
Q4 FY26 → Q1 FY27	Keep operating margin "broadly around the band" (~34–36%)	35% in Q1 (vs 33% in Q4) — held and improved on a richer DCR mix	Delivered
Q4 FY26 → Q1 FY27	6 GW integrated plant on schedule; equipment procurement underway	All major equipment ordered, 60% of hard-cost orders placed, debt tied up	Delivered (so far)
Q1 FY27 (new)	New: ~₹2,400 crore EBITDA target for FY27; wafer plant phased 5 GW FY29 + 4 GW FY30	Too early — first quarter of a full-year target; wafer spend not yet committed	Too-early

Narrative drift: Across all four calls the story has stayed steady and internally consistent — the same four pillars every time (integrated capacity, made-in-India/DCR demand, a disciplined debt-free balance sheet, and margin protection through order-backed procurement). The one meaningful *evolution* this quarter is a good one: management, which had previously refused hard targets, gave a specific ₹2,400 crore EBITDA number — a step up in transparency rather than a change of story. The honest caveats remain: the sequential revenue dip (timing-related, but worth watching), a tightening non-DCR module market that one analyst flagged, and the fact that the new full-year target and the multi-year plant/wafer plans have yet to be delivered.

5. Bottom line — two verdicts

Durable earning trigger? → YES *vs last quarter: unchanged*

Nothing weakened the trigger this quarter — if anything it strengthened. The driver is a funded capacity expansion into integrated cell-and-panel manufacturing, riding India's made-in-India solar mandates, and the evidence kept building: revenue up 51% year-on-year, order book up to 9.9 GW, cell utilization up to 83%, the DCR (made-in-India) mix crossing 50%, and margins improving to 35%. The key policy tailwind — ALMM List 2 — is now legally in force rather than pending, and the 6 GW plant has moved from "construction started" to "equipment ordered." The biggest genuine risk is future industry overcapacity and a tightening non-DCR module market squeezing prices, but as of this call that risk has not shown up in Emmvee's margins.

Management consistent? → MAYBE *vs last quarter: unchanged (strengthening toward YES)*

What moved this quarter was positive: management delivered again (margins held and improved, costs disciplined, the plant on schedule) and, for the first time, gave a concrete full-year EBITDA target of ~₹2,400 crore — a genuine step up in transparency. The four-pillar story has not drifted across four calls. The verdict stays MAYBE — rather than upgrading to YES — for two honest reasons: the track record is still under a year, and the newly-given target (and the multi-year plant and wafer plans) have not yet had time to be delivered. Giving a hard number is a consistency *signal*; hitting it is the proof. One or two more quarters of delivery against this target should tip this to YES.
