1 Snapshot

Emmvee is a Bengaluru company, in solar since 1992, that makes solar panels ("modules") and the solar cells that go inside them. Cells are the small squares that turn sunlight into electricity; panels are the finished product. It sells mostly to Indian power developers and businesses building solar plants, about a quarter to rooftop and farm-pump schemes, and sells some spare cells to other panel makers. It listed in November 2025.

Data note: Screener's tables for Emmvee are standalone and miss most of the group's profit, so its P/E of 199 is misleading. All operating numbers below are management's consolidated figures from the call.

Item	Number	What it means in plain words
Market value	₹17,366 cr	Share price ₹251, down from ₹331 at our last report, roughly a quarter lower, even though results held up.
Q2 FY27 sales	₹1,576 cr	Up 39% on a year ago and about level with Q1.
Q2 FY27 EBITDA	₹557 cr (35.3%)	Operating profit before interest, tax and wear-and-tear. About 35 paise per rupee of sales, same as Q1.
Q2 FY27 net profit	₹382 cr	Up 61%. Profit grows faster than sales because interest cost fell to ₹9.5 cr from ₹55 cr a year ago after the IPO money cleared old loans.
H1 FY27	Sales ₹3,132 cr, EBITDA ₹1,105 cr, profit ₹762 cr	Half the way to the full-year operating-profit guide, with the bigger half of the year still to come.
P/E on group profit	About 12	On roughly ₹1,420 cr of last-twelve-months group profit. Cheap for this growth, which says the market doubts how long the margins last.
Net debt to equity	0.12×	Low. It drew ₹828 cr of loans for the new plant this quarter; that interest is being added to the plant cost until it starts.
Order book	10.4 GW	Confirmed orders, up from 9.9 GW. About 5-5.5 GW of it ships in the next 12-15 months.

2 Concall coverage

Quarter	Call date	Transcript read?
Q2 FY26 → Q4 FY26 (3 calls)	Dec 2025 - 29 Apr 2026	Carried forward from the Q4-2026 and Q1-2027 reports
Q1 FY27 (prior boundary)	16 Jul 2026	Read in full for the Q1-2027 report; backstory here
Q2 & H1 FY27	**15 Oct 2026**	**Newly deep-read in full ★**

Only the 15 October call was read in full. Emmvee has held five calls since listing, so the record is still short, about a year.

Latest concall highlights: Q2 FY27 (call 15 Oct 2026)

- **Steady quarter, best half-year ever.** Sales ₹1,576 cr (+39%), EBITDA ₹557 cr at 35%, profit ₹382 cr (+61%). Operating cash flow ₹410 cr in H1 against ₹121 cr a year ago, so the profit is turning into cash.
- **Guidance held, at the top end.** Asked about the FY27 operating-profit target of ₹2,200-2,400 cr, the CEO said "we can definitely achieve the upper part of the guidance".
- **Cells are full.** Cell plants ran at 89%, up from 83%, hitting the 85-90% target given two quarters ago. Cell output 513 MW (+61%). Panel plants at 44%, which management says is normal since panels top out around 60%.
- **Record orders.** 1.5 GW of new orders in the quarter, the most ever. About 70% of the order book is made-in-India-cell (DCR) business, the higher-margin kind.
- **New plant on schedule.** Equipment for the 6 GW cell-and-panel plant ships from end-October and is in place by November. Panel line December 2026, cell line March 2027. A state capital subsidy (25% on the last project) is expected again but isn't in the guidance.
- **Watch item:** the made-in-India cell rule (ALMM List-II) got "transitional provisions" and now bites fully from December 2026, later than the June date we had last time. A peer is quoting DCR panels at ₹17 a watt; management says current prices are better and that cost cuts keep margin intact.

Business mix & capacity

Domestic vs export: essentially all sales are in India; no exports mentioned.
Customer mix (panels): about 25% retail and farm-pump schemes, 75% power developers and businesses. The largest single customer was 44% of Q2 revenue against 19% in FY26; management called it normal delivery timing and said orders are paid upfront or backed by letters of credit.
Made-in-India mix: DCR above 50% of sales again, about 70% of the order book.
Capacity: 10.3 GW panels at 44%, 2.94 GW cells at 89%. After the new plant: 16.3 GW panels and 8.9 GW cells by end-FY27, sized so the two produce roughly the same output. Plain read: cells are the bottleneck today and the new plant fixes it.

Since our last report

Builds on the Q1-2027 report (call 16 Jul 2026). Prior verdicts: **Trigger YES**, **Consistency MAYBE** (strengthening toward YES, pending delivery on the new target).

Prior read	What we said then	What the new call shows	Movement
Trigger: YES	Funded capacity build riding made-in-India demand.	Record orders, cells full, margin steady, plant on track.	Confirmed
Consistency: MAYBE	Needed delivery against the first-ever target.	H1 EBITDA ₹1,105 cr, on pace for the top of the range; cell target hit; plant dates held.	Improving
FY27 EBITDA about ₹2,400 cr	First hard number, too early to judge.	Reaffirmed, "upper part" achievable.	On-track
Cell utilisation to 85-90%	83%.	89%.	Confirmed
6 GW plant (panels Dec 2026, cells Mar 2027)	Equipment ordered, 60% of hard cost placed.	Equipment through factory tests, shipping now, in place by November.	On-track
ALMM List-II live from June 2026	Policy legally in force.	Transitional provisions; full effect from December 2026. Management sees further delay as "extremely unlikely".	Slipping
Wafer plant, 5 GW FY29 + 4 GW FY30	Phased with dates.	Still 9 GW in two phases, but timing now "guided by" ALMM List-III, market conditions and viability. No dates repeated.	Slipping (softer)

Verdict change: trigger unchanged at YES. Consistency upgraded from MAYBE to YES: we said one or two quarters of delivery against the new target would tip it, and this quarter delivered on the target, the cell-utilisation promise and the plant timeline.

3 Earning-trigger thesis

Is there a real earning trigger here?

Yes. India is installing solar faster than ever (management cites about 27 GW installed in the first half of this calendar year) and the rules increasingly force projects to use Indian-made cells. Emmvee already makes TOPCon cells, the current mainstream type, runs them nearly full, and is roughly tripling cell capacity by March 2027 with the money already in place. That's a clear, funded driver that's already in the numbers. The risk is the one everyone sees: lots of new Indian cell and panel capacity is coming, and prices per watt are falling. Emmvee says it protects profit per watt by using less silver and moving to bigger, more efficient cells, and so far margin has held at 35%.

Trigger	What management said	Evidence so far	Time horizon	Strength	Change since last report
6 GW integrated plant	Panel line "ready by December 2026", cell line by March 2027; capacity to 16.3 GW / 8.9 GW.	Equipment shipping from end-October; ₹5,500 cr cost, ₹4,600 cr of it hard cost; debt tied up.	Q4 FY27 - FY28	Strong	↑ from "ordered" to "shipping"
Made-in-India cell demand (ALMM / DCR)	Further delay "looks extremely unlikely"; DCR demand from rooftop, pump and business schemes "growing much faster".	DCR above 50% of sales, 70% of orders; record 1.5 GW inflow.	Now - FY30	Strong	Unchanged; rule's full start moved to Dec 2026

Cell efficiency and cost	Silver use down from about 220 mg to 60-65 mg a cell; G12R larger cells now over half of capacity.	Cells at 89% utilisation; margin held at 35% while selling prices drift down.	Ongoing	Moderate	↑ cell target hit
Wafer backward integration	9 GW in two phases; timing depends on ALMM List-III and economics.	Plan only, no capital committed.	FY29+	Unproven	↓ dates dropped from the script

4 Management consistency scorecard

Period	What was promised	What actually happened	Verdict
Q2-Q4 FY26	Second 2.5 GW line, repay IPO-funded debt, margin around 34-36%.	All done; carried forward from earlier reports.	Delivered
Q3 FY26 → Q2 FY27	Cell utilisation to about 85-90%.	79% → 83% → 89%.	Delivered
Q4 FY26 → Q2 FY27	Keep margin broadly in the 34-36% band.	35% in Q1 and 35.3% in Q2.	Delivered
Q1 FY27	About ₹2,400 cr EBITDA for FY27.	₹1,105 cr in H1; "upper part" of ₹2,200-2,400 cr reaffirmed.	On track
Q4 FY26 → Q2 FY27	6 GW plant: panels Dec 2026, cells Mar 2027.	Dates unchanged for three calls running; equipment arriving.	On track
Q1 FY27	Wafer plant phased FY29 / FY30.	Dates not repeated; now tied to policy and economics.	Softened

Narrative drift. Very little. Five calls in, the story is the same four things every time: integrated capacity, made-in-India demand, low debt and protecting profit per watt. The numbers have matched. Two small things to watch. The wafer plan sounded firmer in July than in October, which looks like sensible caution while the government decides on wafer rules, not a broken promise. And management gave short answers on the rise in customer concentration and on the dip in gross margin. Neither is a red flag yet, but both are worth asking about again.

5 Bottom line

DURABLE EARNING TRIGGER? → YES vs last quarter: unchanged

Nothing weakened it. Orders hit a record, cells ran nearly full, margin held at 35% and the new plant is arriving on time to roughly triple cell capacity. The made-in-India cell rule's full start slipped to December, but projects bid under it must comply regardless and DCR is already most of the order book. The real risk is industry overcapacity pushing panel prices down through FY28. So far Emmvee has cut costs as fast as prices fell. The stock's fall since July suggests the market is pricing that risk harder than the results show.

MANAGEMENT CONSISTENT? → YES vs last quarter: upgraded from MAYBE

What moved it: the first hard target given in July is on pace for its top end, the cell-utilisation promise was hit, and the plant dates held for a third straight call. That's the delivery we said we needed. Caveat: it's still only about a year of listed history, and the wafer dates softened. If the panel line misses December or margin breaks below the band, this goes back to MAYBE quickly.
